

COM-IC

Highlighting what's important
to people with lived experience

**UQCHSR's Health Economics team
invites you to the launch of
COM-IC's recommendations.**

**2 weeks
to go!**

WHY ELSE WAS COM-IC SPECIAL?

Part of what made COM-IC so special was the **geographical diversity** our project members represent.

This required us to **embrace technology to come together** to create a Core Outcome Set for routine care of people living with dementia.

WHAT REAL TIME TECH WAS USED?

Synchronous communication means exchanging information and ideas in **real time**.

This might be face-to-face, but increasingly it's via phone or internet.

The COM-IC team used **phone** and **web-chat** to periodically check-in with each other, with weekly **zoom drop-in sessions** fast becoming a favourite.

WHAT WRITTEN TECH USED?

Asynchronous communication happens at different times, usually through something **written**.

But we've progressed a long way from snail-mail!

Our project would not have been the as effective without our **discussion board, hosted on Loomio**, and the **UQ research data management system, which helped us share files**.

WHAT DOES IT LOOK LIKE IN PRACTICE?

Our stakeholders were able to share the benefits of all these communication techniques through **demonstration at the 2024 HSRAANZ conference** in Brisbane.

Some stakeholder reference group members appeared **in person**, while others used **video recordings** to communicate asynchronously with conference delegates.

WHAT WILL IT LOOK LIKE NOW?

We also wouldn't be able to share our work more broadly without the **STARDIT report** and the **COM-IC website** (more on these at our launch!)

COM-IC LAUNCH

Mon 29 Sep, 9am AEST online

We'd love to see you at our
synchronously
communicated
virtual event!!
